New Phenomena in Gamma-Ray Strength Functions

Ronald Schwengner

Institute of Radiation Physics, Helmholtz-Zentrum Dresden-Rossendorf,
01328 Dresden, Germany

• Experiments:
  - Photon scattering using bremsstrahlung at γELBE and quasi-monoenergetic polarized γ rays at HIγS
  - Data analysis

• E1 strength in the pygmy region
• M1 strength in the spin-flip region
• Low-energy M1 strength
Photonuclear and radiative-capture reactions

Excitation and deexcitation of the nucleus by $\gamma$ rays:

- Statistical models applied to describe reaction rates at high excitation energy and high level density.
- $\gamma$-ray strength functions used to describe average transition strengths in a certain energy range.
- Understanding of the properties of $\gamma$-ray strength functions attracts increasing interest.

Application:

- Photonuclear and radiative-capture reactions play a central role in the synthesis of the elements in various stellar environments.
Effect of enhanced low-energy dipole strength in the r-process

"The nucleus goes red."
Unexpected upbend of dipole strength toward low energy observed in Fe, Mo, Cd isotopes.

Courtesy of M. Guttormsen.

⇒ Big influence of low-energy strength on neutron-capture rates of very neutron-rich nuclei in the astrophysical r-process.

Ratios of Maxwellian-averaged \((n,\gamma)\) reaction rates at \(T = 10^9\) K for isotopic chains up to the neutron drip line using strength functions with and without low-energy upbend of dipole strength.

**Gamma-ray strength functions**

- Gamma-ray strength functions describe average electromagnetic transition strengths in the quasicontinuum of nuclear states at high excitation energy:

  \[ f_{i\ell}(E_{\gamma}) = \frac{T_{i\ell} \rho(E_i, J_i)}{E_{\gamma}^{2\ell+1}} \quad E_{\gamma} = E_i - E_f \quad J_i = 0, \ldots, J_{\text{max}} \]

- Photoabsorption:

  \[ f_L = \sigma_\gamma / \left[ (2J_i+1)/(2J_0+1) \right. \quad E_{\gamma} = E_i \quad J_i = 1, \quad (2) \]

- Brink-Axel hypothesis:
  The strength function does not depend on the excitation energy.
  The strength function for excitation is identical with the one for deexcitation.
The bremsstrahlung facility at the electron accelerator ELBE

**Accelerator parameters:**

- Maximum electron energy: 
  \[ \approx 18 \text{ MeV} \]
- Maximum average current: 
  \[ \approx 0.8 \text{ mA} \]
- Micro-pulse rate: 
  \[ 13 \text{ MHz} \]
- Micro-pulse length: 
  \[ \approx 5 \text{ ps} \]

What is the origin of the upbend?
Calculations of M1 strength functions

Can model calculations describe the low-energy upbend of dipole strength?

Shell-model calculations:

- 40 levels of each spin from 0 to 10 for each parity.
- All possible transitions between these 440 states - about 24000 M1 transitions.
- Average $B$($M1$) values in bins of $E_\gamma$.
- M1 strength function.

Codes:

- NuShellX@MSU

- RITSSCHIL

Dipole strength functions in $^{151}$Sm and $^{153}$Sm

(p,d) data:
A. Simon et al.
PRC 93, 034303 (2016)

⇒ First observation of upbend and scissors resonance in one nuclide.

⇒ Strength in the scissors region about three times that found in ($\gamma$, $\gamma$) experiments.
Strength functions from shell-model calculations

Dipole strength function

\[
f_1 = \frac{16\pi}{9} (\hbar c)^{-3} \overline{B}(M1) \rho(E_x, J)
\]

\(\rho(E_x, J)\) - level density of the shell-model states, includes \(\pi = +, \pi = -\), all spins from 0 to 10.

R.S. et al., PRL 118, 092502 (2017)

⇒ Strength in the scissors region about three times that found in \((\gamma, \gamma)\) experiments.
Summary

- Photon-scattering experiments with broadband bremsstrahlung at $\gamma$ELBE and with quasimonoenergetic $\gamma$ rays at HI$\gamma$S up to the neutron-separation energies.

- Strength in the quasicontinuum of states included. Observed strength corrected for branching and feeding by means of statistical methods.

- Novel experimental information about the behavior of the full E1 strength in the pygmy region and the M1 strength in the spin-flip region for nuclides around masses 80, 130 and 180.

- Large-scale shell-model calculations of M1 and E2 strengths.
  - Description of the experimental low-energy upbend by enhanced M1 strength.
  - Correlation between the low-energy M1 radiation and the scissors mode in open-shell nuclei.
  - Explanation of different strengths found in photoexcitation and in light-ion reactions.

⇒ Modification of phenomenological strength functions used as input of statistical reaction codes needed.
